

UI/UX Design & Frontend Integration for Student Systems

My name is Anggun, and I am a tenth-grade student at SMK Tenganan today. I study Software Engineering with a focus on web development every day. I design user interfaces using Figma quite often. My passion for coding grows stronger every single week. I build many web projects with my friends at school nowadays. I express my creativity through modern web design concepts currently.

Last semester, I joined a collaborative web development project in class. I worked with a team to build a student management system efficiently. We discussed the project goals thoroughly at the beginning. I felt very enthusiastic because I collaborated with talented friends then. We used Bootstrap as our main framework for the development process. I prepared the initial structure of our website carefully.

We divided the workload among our team members equally. I designed the user interface using Figma before the coding phase began. My team integrated several components like breadcrumbs and tables into the system yesterday. We solved many layout disagreements through open discussions last week. We fixed all the bugs together to ensure a smooth performance then. The project challenged our communication skills significantly during the process.

The team completed the project on time with great results recently. I felt proud because my design worked well on the browser then. This experience gave me a deep understanding of software team workflows last month. I learned that programming required effective collaboration, not just individual effort. I set a new goal to improve my technical skills shortly after the project. This memory motivated me to work harder in the tech industry afterward.
